4 Inference

Sockets are a protocol independent method of creating a connection between processes. Sockets can be either

- **connection based** or **connectionless**: Is a connection established before communication or does each packet describe the destination?
- **packet based** or **streams based**: Are there message boundaries or is it one stream?
- **reliable** or **unreliable**. Can messages be lost, duplicated, reordered, or corrupted?

Socket Characteristics

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem description

3 Problem Dissection

4 Inference

Socket are characterized by their domain, type and transport protocol. Common domains are:

- **AF_UNIX**: address format is UNIX pathname
- **AF_INET**: address format is host and port number

Common types are:

- **Virtual Circuits**: received in order transmitted and reliably
- **datagram**: arbitrary order, unreliable

Socket Characteristics (cont'd)

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem description

3 Problem Dissection

4 Inference

Each socket type has one or more protocols. Ex:

- TCP/IP (virtual circuits)
- UDP (datagram)

Use of sockets:

- Connection-based sockets communicate client-server: the server waits for a connection from the client.
- Connectionless sockets are peer-to-peer: each process is symmetric.

Socket APIs

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem description

3 Problem Dissection

4 Inference

- `socket`: creates a socket of a given domain, type, protocol (buy a phone)
- `listen`: assigns a name to the socket (get a telephone number)
- `accept`: specifies the number of pending connections that can be queued for a server socket. (call waiting allowance)
- `connect`: client requests a connection request to a server (call)
- `send`, `sendto`: write to connection (speak)
- `recv`, `recvfrom`: read from connection (listen)
- `shutdown`: end the call

Problem Description

Compile the program

Problem Dissection

Macro... Macro..

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem
description

3 Problem
Dissection

4 Inference

Unnoticed macro _

```
#define _ -F<00||--F-00--;
```

What macro does?

- Replaces '_' with '-F<00||--F-00--;'
- for eg: '_-_-_' becomes '-F<00||--F-00--;- -F<00||--F-00--;- -F<00||--F-00--;'
- One of the important property of || operator is that if the first condition is **true**, it will **NOT** check for the second condition unlike && operator.

Problem Dissection

Values of variables inside F_00 ()

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem
description

3 Problem
Dissection

4 Inference

Values of F and 00

- F and 00 are initially set as *zero*.
- In the first line of F_00 function, $-F < 00$ becomes **false** hence checks for the second condition.
- $--F$ becomes -1 and $00--$ remains as 0.
- After the execution of the first line, value of F becomes -1 and 00 becomes -1.

Problem Dissection

Values of F and OO inside F_00 ()

Bingo! Wiki rocks

http://en.wikipedia.org/wiki/International_Obfuscated_C_Code_Contest#Examples

The same example is mentioned in the above mentioned link and it says that the program works by calculating its own area and diameter, and then doing a division to approximate pi!!

They call it as an Obfuscated C code

Problem Dissection

How does it calculates the value of Π ?

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

- 1 Socket
- 2 Problem description
- 3 Problem Dissection
- 4 Inference

Lets do reverse engineering!

Using the hint in Wiki, we found that program works by calculating its own area and diameter. So we need to make the Π , Area, radius/diameter looks like

4 . * - F / 00 / 00.

So lets do reverse Engineering!

Problem Dissection

Calculating the value of Π

CS620 Advanced Computer Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem
description

3 Problem
Dissection

4 Inference

Calculating the value of Π from Area and radius/diameter

$$\text{Area} = \Pi * \text{radius}^2$$

$$\Pi = \text{Area} / \text{radius}^2$$

As we need 4 in the numerator we may have to substitute radius with diameter.

$$\Pi = \text{Area} / (\text{diameter}/2)^2$$

$$\Pi = 4 * \text{Area} / (\text{diameter} * \text{diameter})$$

$$\Pi = 4 * \text{Area} / \text{diameter} / \text{diameter}$$

Inference

What can we conclude from this?

CS620 Advanced
Computer
Networks

Course Mentor:
Snehal Shetty
TA: Seshagiri
Prabhu

1 Socket

2 Problem
description

3 Problem
Dissection

4 Inference

Conclusion

Variable **F** is the area of the circle used in the program
The Diameter of the circle is the variable **OO**

Learning

What's new I have learned from this?

Learning something new

Previously, I have tried to de-obfuscating PHP code (in which they used base64 encoding, rot 13 transformation etc) files during Capture The Flag contests. This is the first time I am hearing about C code obfuscation. That was a nice learning experience!
